Title: CHEMICAL VAPOR DEPOSITION OF TITANIUM

IN THE CLAIMS

Please amend the specification as follows.

- 1. 43. (Cancelled)
- 44. (Currently Amended) An integrated circuit comprising:

a layer of a titanium alloy covering the walls and bottom of a contact hole, the layer of titanium alloy having a similar chemical profile in walls and a base portion of the layer of titanium alloy, wherein the titanium alloy comprises titanium and an element selected from the group consisting of zinc, cadmium, mercury, aluminum, gallium, indium, tin, germanium, lead, arsenic and antimony; and

a titanium silicide contact formed from interaction between the layer and the bottom of the contact hole.

- 45. (Original) The integrated circuit of claim 34, wherein the titanium alloy comprises titanium and zinc.
- 46. 59. (Cancelled)
- 60. (Currently Amended) An integrated circuit comprising:
 - a semiconductor substrate;

an electronic device coupled to the semiconductor substrate, the electronic device having an active region;

an insulating layer over the active region;

an alloy layer of a titanium alloy covering the walls and bottom of a contact opening in the insulating layer, the layer of titanium alloy having a similar chemical profile in walls and a base portion of the layer of titanium alloy, the contact opening being at least partially over the active region, wherein the titanium alloy comprises titanium and an element selected from the

group consisting of zinc, cadmium, mercury, aluminum, gallium, indium, tin, germanium, lead, arsenic and antimony; and

a titanium silicide contact formed from interaction between the alloy layer and the active region.

- 61. (Previously Presented) The integrated circuit of claim 60, wherein the titanium alloy includes titanium and zinc.
- 62. (Previously Presented) The integrated circuit of claim 60, wherein the insulator layer includes silicon dioxide (SiO2).
- 63. (Previously Presented) The integrated circuit of claim 60, wherein the electronic device includes a transistor.
- 64. (Currently Amended) An integrated circuit comprising:
 - a semiconductor substrate;
- a transistor formed on the semiconductor substrate, the transistor having a source/drain region;

an insulating layer over the source/drain region;

an alloy layer of a titanium alloy covering the walls and bottom of a contact opening in the insulating layer, the layer of titanium alloy having a similar chemical profile in walls and a base portion of the layer of titanium alloy, the contact opening being at least partially over the source/drain region, wherein the titanium alloy comprises titanium and an element selected from the group consisting of zinc, cadmium, mercury, aluminum, gallium, indium, tin, germanium, lead, arsenic and antimony; and

a titanium silicide contact formed from interaction between the alloy layer and the source/drain region.

65. (Previously Presented) The integrated circuit of claim 64, wherein the titanium alloy includes titanium and zinc.

Title:

CHEMICAL VAPOR DEPOSITION OF TITANIUM

- 66. (Previously Presented) The integrated circuit of claim 64, wherein the insulator layer includes silicon dioxide (SiO2).
- 67. (Previously Presented) The integrated circuit of claim 64, wherein the contact opening includes a high aspect ratio contact opening.
- 68. (Currently Amended) An integrated circuit comprising:
 - a semiconductor substrate;
- an electronic device formed on the semiconductor substrate, the electronic device having an active region;
 - a borophosphous silicate glass (BPSG) layer over the active region;
- an alloy layer of a titanium alloy covering the walls and bottom of a contact opening in the borophosphous silicate glass (BPSG) layer, the layer of titanium alloy having a similar chemical profile in walls and a base portion of the layer of titanium alloy, the contact opening being at least partially over the active region, wherein the titanium alloy comprises titanium and an element selected from the group consisting of zinc, cadmium, mercury, aluminum, gallium, indium, tin, germanium, lead, arsenic and antimony; and
- a titanium silicide contact formed from interaction between the alloy layer and the active region.
- 69. (Previously Presented) The integrated circuit of claim 68, wherein the titanium alloy includes titanium and zinc.
- 70. (Previously Presented) The integrated circuit of claim 68, wherein the electronic device includes a transistor.
- 71. (Previously Presented) The integrated circuit of claim 68, wherein the contact opening includes a high aspect ratio contact opening.

Title: CHEMICAL VAPOR DEPOSITION OF TITANIUM

72. (Currently Amended) An integrated circuit comprising:

a semiconductor substrate;

an electronic device coupled to the semiconductor substrate, the electronic device having an active region;

an insulating layer over the active region;

an alloy layer of a titanium alloy covering the walls and bottom of a high aspect ratio contact opening in the insulating layer, the layer of titanium alloy having a similar chemical profile in walls and a base portion of the layer of titanium alloy, the high aspect ratio contact opening being at least partially over the active region, wherein the titanium alloy comprises titanium and an element selected from the group consisting of zinc, cadmium, mercury, aluminum, gallium, indium, tin, germanium, lead, arsenic and antimony; and

a titanium silicide contact formed from interaction between the alloy layer and the active region.

- 73. (Previously Presented) The integrated circuit of claim 72, wherein the titanium alloy includes titanium and zinc.
- 74. (Previously Presented) The integrated circuit of claim 72, wherein the electronic device includes a transistor.
- 75. (Previously Presented) The integrated circuit of claim 72, wherein the insulator layer includes silicon dioxide (SiO2).
- 76. (Previously Presented) The integrated circuit of claim 72, wherein the insulator layer includes borophosphous silicate glass (BPSG).
- 77. (Currently Amended) An integrated circuit comprising:
 - a semiconductor substrate;
- a transistor coupled to the semiconductor substrate, the transistor having a source/drain region;

Title: CHEMICAL VAPOR DEPOSITION OF TITANIUM

an insulating layer over the source/drain region;

an alloy layer of a titanium alloy covering the walls and bottom of a high aspect ratio contact opening in the insulating layer, the layer of titanium alloy having a similar chemical profile in walls and a base portion of the layer of titanium alloy, the high aspect ratio contact opening being at least partially over the source/drain region, wherein the titanium alloy comprises titanium and an element selected from the group consisting of zinc, cadmium, mercury, aluminum, gallium, indium, tin, germanium, lead, arsenic and antimony; and

a titanium silicide contact formed from interaction between the alloy layer and the source/drain region.

- 78. (Previously Presented) The integrated circuit of claim 77, wherein the titanium alloy includes titanium and zinc.
- 79. (Previously Presented) The integrated circuit of claim 77, wherein the insulator layer includes silicon dioxide (SiO2).
- 80. (Previously Presented) The integrated circuit of claim 77, wherein the insulator layer includes borophosphous silicate glass (BPSG).
- 81. (Currently Amended) An integrated circuit comprising:
 - a semiconductor substrate;
- a transistor coupled to the semiconductor substrate, the transistor having a source/drain region;
 - a borophosphous silicate glass (BPSG) layer over the source/drain region;

an alloy layer of a titanium alloy covering the walls and bottom of a high aspect ratio contact opening in the borophosphous silicate glass (BPSG) layer, the layer of titanium alloy having a similar chemical profile in walls and a base portion of the layer of titanium alloy, the high aspect ratio contact opening being at least partially over the source/drain region, wherein the titanium alloy comprises titanium and an element selected from the group consisting of zinc, cadmium, mercury, aluminum, gallium, indium, tin, germanium, lead, arsenic and antimony; and

AMENDMENT AND RESPONSE UNDER 37 CFR § 1.116 - EXPEDITED PROCEDURE

CHEMICAL VAPOR DEPOSITION OF TITANIUM

Page 7 Dkt: 303.676US2

a titanium silicide contact formed from interaction between the alloy layer and the source/drain region.

- (Previously Presented) The integrated circuit of claim 81, wherein the titanium alloy 82. includes titanium and zinc.
- (Currently Amended) An integrated circuit comprising: 83.

a semiconductor substrate;

an electronic device coupled to the semiconductor substrate, the electronic device having an active region;

an insulating layer over the active region;

an alloy layer of a titanium alloy covering the walls and bottom of a contact opening in the insulating layer, the layer of titanium alloy having a similar chemical profile in walls and a base portion of the layer of titanium alloy, the contact opening being at least partially over the active region, wherein the alloy layer is produced using a method including:

forming a seed layer supported by a substrate, wherein the seed layer is selected from the group consisting of zinc, cadmium, mercury, aluminum, gallium, indium, tin, germanium, lead, arsenic and antimony by combining a first precursor with a first reducing agent;

forming the titanium alloy layer supported by the substrate by combining a titanium-containing precursor with the seed layer; and

a titanium silicide contact formed from interaction between the alloy layer and the active region.
